- Result/outcomes
- Conclusion

Problem Statement

- Entrepreneurs and all businesses struggle to select the right location due to the absence of reliable, data-driven insights.
- Most location decisions rely on personal assumptions, limited surveys, or outdated/incomplete information from existing platforms.
- Current tools fail to provide predictive analysis, real-time trends, or insights into demographics, customer behavior, and competition levels.
- This lack of analytical information leads to choosing unsuitable areas with low customer reach, high competition, or weak economic conditions.
- Poor location selection results in financial losses, business failures, and inefficient use of resources highlighting the need for an AI-powered system to guide informed decisions.

Project overview - Introduction

- This project is **an intelligent decision-support system** designed to help entrepreneurs and investors choose the most profitable business locations using data-driven insights instead of assumptions.
- This project uses Machine Learning model to predict and rank locations and AI to give structured insights about the location.
- Many businesses fail due to poor location selection, high competition, and lack of market research. Entrepreneurs often rely on assumptions instead of real data. This system reduces risk by providing intelligent, data-backed insights before starting or expanding a business.
- This system:
 - Recommends the **top 3 areas** based on business type, investment, and target customers in Maharashtra
 - Evaluates a specific area's suitability as **High, Medium, or Low** using an ML model.
 - Identifies **untapped niche opportunities** in a city and generates a complete business plan in PDF format.

End User

Wow factor of Local Insight AI

1. AI GENERATED COMPLETE BUSINESS STRATEGY

Automatically generates:

- Business Name
- Executive Summary
- Target Market Segmentation
- Regional Advantage
- Phase-wise Implementation Plan

Converts raw data → Structured Strategic Roadmap

2. MARKET GAP DETECTION ENGINE

Automatically Detects :

- Detects under represented niches
- Identifies saturation vs demand imbalance
- Suggests smarter business categories

Moves beyond “where to open” → “what to open”

3. CUSTOM “OPPORTUNITY SCORE” ALGORITHM

Proprietary formula combining :

- Population
- Youth Ratio
- Footfall
- Competition Density
- Rent Factor
- Produces a ranked recommendation of top areas

Adds algorithmic intelligence instead of static reports.

4. AI SCENARIO SIMULATION (What-If Engine)

- User adjusts rent / competition / footfall
- System recalculates opportunity instantly

Modelling

$$\text{Success Ratio} = \frac{N_{high_rating}}{N_{total}}$$

Where,

- N_{high_rating} represents the number of establishments in a specific category within an area that have a rating above 4.0 and receive more than 50 customer review.
- N_{total} represents the total number of establishments in that category within the same area.

Result / Outcomes

Prediction Dashboard

Evaluation Dashboard

Startup Plan Builder

Conclusion

- Converts traditional location selection into a **data-driven decision process**.
- Uses **Machine Learning** to predict and rank the top 3 **profitable areas**.
- Evaluates area suitability as **High, Medium, or Low** to reduce business risk.
- Finds **business opportunities with less competition**.
- Generates a **complete structured business plan (PDF)** for confident decision-making.
- Transforms complex business data into **clear, actionable strategic insights**, making advanced analytics accessible to every entrepreneur.

Thank You
